

Batteries2030+ Roadmap

Thematic area: BMS

Joris de Hoog Vrije Universiteit Brussel Battery Innovation Centre

BMS – What is it?

ELECTROMOBILITY

Safe operation Cell balancing Range prediction Current limiting Communication Thermal management

BMS - Topology

Slave incorporated in the master Only small systems

Distributed, simple BMS per cell Not widely used

> ELECTROMOBILITY RESEARCH CENTRE

Modular layout, typical for EV's

Decentralized, BMS unit combines slave and master functions

https://doi.org/10.1007/978-3-030-52794-5_13

BMS - role in current B2030+ roadmap projects

BMS – Core topic in B2030+ projects

- Gas
- ToF
- Reference electrode
- Fiberoptic thermals and pressure
- Interface resistance
- Electrochemical sensors
- reference electrode

More advanced sensors

actuation complex More

- Induce heating
- Induce pressure
- Apply magnetic field
- Run physics-based model
- Data-driven (ML) SOx models
- Reinforcement learning
- Integrate into EMS
- Minimize component cost
- Run real-time
- Cloud-integration
- Cyber-secure

BMS – Integration into Roadmap

Role of BMS beyond first life

Integration of BMS in BIGMAP for validation

Role of BMS in manufacturing

Role of BMS in Digital Battery Passport

BMS for pack performance optimization

• • •

BMS – Other research topics

BMS second life Modular design Input for recycling Cloud-based BMS Minimal hardware World model integration Digitalization

Digital twin Vehicle model integration

Thank you
